

GeoPackage

alternative encoding for INSPIRE

Francisco J. Lopez-Pellicer
MIG-T 2019-02-28

1. Introduction
2. Scope
3. Encoding rules
4. Experience with real datasets

Introduction

- GeoPackage is an open, standards-based, platform-independent, portable, self-describing, compact format for transferring geospatial information
 - A SQLite database (a single file!!)
 - Current versión 1.2.1 <https://www.geopackage.org/spec121/index.html>
- It is a set of conventions for storing:
 - Vector features (with linear and non-linear geometry types)
 - Tile matrix sets of imagery, raster maps at various scales
 - Tile gridded coverage data
 - Attributes (non spatial data)
 - Metadata (coarse to fine grained) and schema constraints
- Within INSPIRE, this encoding is an *alternative* encoding for data from all themes, focused in data sharing of datasets with no loss of information between GIS desktops, network servers, corporate databases, web and mobile applications.
- Max size: approximately 140TB → Big Data sharing!!

Scope

- Use cases
 - Addresses data usability in desktop (QGIS3, ArcGIS), native mobile (NGA iOS and Android SDK), web (NGA JS), servers (NGA Java) and geoprocessing software (GDAL).
 - The encoding does not cover yet 3D geometries
 - We have tested desktop (QGIS3), geoprocessing software (GDAL) and server (NGA Java)
- Coverage of INSPIRE Themes
 - We have tested Annex I: Geographical names and Administrative units
- Technical Issues found
 - “Related tables” extension in development → Explicit associations between classifiers
 - GDAL support is not complete → workaround → NGA Java supports all extensions

Encoding rules

- UML model to GeoPackage ≈ UML model to Spatial SQL
 - Classes → SQL Tables
- Used normative references
 - GeoPackage Encoding Standard 1.2.1 <http://www.geopackage.org/spec121/>
 - INSPIRE Geographical Names
 - INSPIRE Administrative Units
- General encoding rules
 - «featureType» → Feature Table per geometry attribute
 - «dataType» with multiplicity n → Attribute Table + Foreign Key
 - «dataType» that may link features (e.g. Identifier) → Attribute Table + Foreign Key
 - «dataType» with multiplicity 0..1 → embedded in Table (nested properties flattened)
 - «codeList» → usually embedded in Table + values constrained via Schema extension
 - «voidable» → keep attribute in Table and void reason value stored via Metadata extension

Experience with real datasets → Datasets

Nomenclátor Geográfico Básico de España

Descripción: relación de topónimos del NGBE.

SGR: ETRS89 en la Península, Islas Baleares, Ceuta y Melilla, y REGCAN95 en las Islas Canarias (ambos sistemas compatibles con WGS84). Coordenadas longitud y latitud y UTM en su huso correspondiente.

Ud. descarga: toda España

Formato: .accdb de Access

[Ver +](#)

Base de datos con la relación de topónimos con sus correspondientes coordenadas y resto de atributos que constituye el Nomenclátor Geográfico Básico de España.

Líneas límite municipales

Descripción: recintos municipales y líneas límite (municipales, provinciales y autonómicos).

SGR: ETRS89 en la Península, Islas Baleares, Ceuta y Melilla, y WGS84 en las Islas Canarias. Coordenadas geográficas longitud y latitud.

Ud. descarga: toda España

Formato: shape (.shp)

Experience with real datasets → Produced SQL DDL/GeoPackage

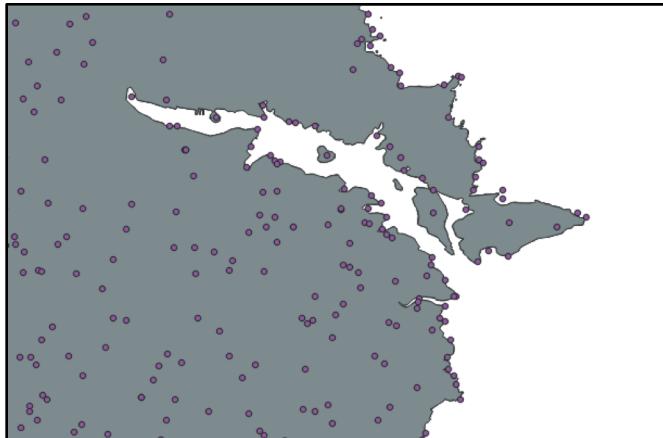

Experience with real datasets → Tools

- NGA GeoPackage Java (certified by OGC)
 - <https://github.com/ngageoint/GeoPackage>
- In-house DSL (written in Kotlin)
 - Creation of any INSPIRE schema within GeoPackage
 - ETL Postgis → GeoPackage
 - Data migration to Postgis → GeoPackage
 - INSPIRE schema creation
 - Population INSPIRE Schema
 - We can publish it as open source if requested
- Development time
 - 4 weeks model/approach analysis
 - 3 weeks DSL development and testing
 - 2 days for the ETL (per dataset)
- Lessons learned
 - Think as SQL developer, not as GIS developer
→ faster development
 - Performance improved if model transformation is executed within SQLite → FME-like scripts will be slow
 - INSPIRE schema templates per theme (empty GeoPackages) → Reusable by-product

```
object GeographicNamesSchema {  
    fun inspireNamedPlaceSchema(effectiveSrsId: Long)  
        tableName = "named_place"  
        identifier = "Geographical Names:NamedPlace"  
        description = "Any real world entity referred to by a name."  
        srsId = effectiveSrsId  
        column {  
            name = "inspire_id"  
            dataType = GeoPackageTypes.INT  
            notNull = true  
            indexed = true  
        }  
        column {  
            name = "geometry"  
            dataType = GeoPackageTypes.GEOMETRY  
            notNull = true  
        }  
        column {  
            name = "begin_lifespan_version"  
            dataType = GeoPackageTypes.DATETIME  
        }  
        column {...}  
        column {  
            name = "least_detailed_viewing_resolution"  
            dataType = GeoPackageTypes.TEXT  
            max = 1  
        }  
        column {...}  
        column {...}  
        column {...}  
        column {...}  
        column {...}  
        column {...}  
        column {...}  
    }  
    val inspireNamedPlaceLocalTypeSchema: AttributeBuilder  
        tableName = "named_place_local_type"  
        identifier = "Geographical Names:NamedPlace.LocalType"  
        description = "Characterisation of the kind of place."  
        srsId = effectiveSrsId  
        column {  
            name = "name"  
            dataType = GeoPackageTypes.TEXT  
            notNull = true  
            indexed = true  
        }  
        column {  
            name = "type"  
            dataType = GeoPackageTypes.TEXT  
            notNull = true  
            indexed = true  
        }  
        column {  
            name = "begin_lifespan_version"  
            dataType = GeoPackageTypes.DATETIME  
        }  
        column {...}  
        column {...}  
        column {...}  
        column {...}  
        column {...}  
        column {...}  
        column {...}  
    }  
}
```

Experience with real datasets → Results

- Geographical Names
 - File size 352 MB
 - Features: NamedPlace (1132583 rows)
 - Attributes: GeographicalName (1317590 rows), SpellingOfName (1317590 rows), + 3 more tables for attributes with multiplicity (localType, relatedSpatialObject, type)
- Administrative Units
 - File size 646 MB
 - Features: AdministrativeUnit (8283 rows), AdministrativeBoundary (45844 rows)
 - Attributes: Identifier (54127 rows), GeographicalName (8283 rows), SpellingOfName (8283 rows), + 1 more table for M:N relation between Boundary and Unit
- Transformation run: 40min
 - In my laptop! x5 faster in a production server!!
- Tested with QGIS3
 - View, edit... fast and satisfactory
 - Join tables feasible (NamedPlace x GeographicalName x SpellingOfName)
