

# **IMPACT: CARBON SEQUESTRATION**

Data extracted in June 2020

This fiche summarises the impact of Agroforestry on CARBON SEQUESTRATION. It is based on a review of 13 peer-reviewed synthesis research papers, each involving 21 to 138 individual papers.

This fiche is part of a set of similar fiches synthesising all the impacts of agroforestry presented in the general fiche 📥

#### 1.WEIGHT OF THE EVIDENCE

• CONSISTENCY OF THE IMPACT: Out of the 13 synthesis papers dealing with this type of impact, 10 show positive effect of agroforestry on carbon sequestration compared to land use without trees (including cropland and pastureland) at the global scale, in Europe and in other continents. Two synthesis papers report an uncertain effect in West Africa (one compared to croplands, and one unspecified, and a third one reports an uncertain effect compared to forest across several continents). Two synthesis papers report a negative effect on carbon sequestration compared to forest or compared to both forest and pastureland. See the tables below for details.

QUALITY OF THE SYNTHESIS PAPERS: [The quality score summarises 16 criteria assessing the quality of three main aspects of the synthesis papers:
1) the literature search strategy and studies selection; 2) the statistical analysis; 3) the potential bias. The scores can be found in the Excel database with all the data extracted from the synthesis papers]

As shown in the "Quality score" of the table in section 2, the quality level ranges from 31% to 100%, with only two synthesis papers with a quality score lower than 50%. The least frequently satisfied quality criteria were those related to the analysis of heterogeneity of the effects (satisfied in 5 synthesis papers out of 13), weighting of individual studies (5 out of 13), presentation of individual effect sizes (5 out of 13), dataset availability (5 out of 13), the number of studies selected at each step of the selection procedure (4 out of 13), analysis of publication bias (3 out of 13).

• NUMBER OF SCIENTIFIC PAPERS: The number of papers included in each synthesis paper ranges from 21 to 138.

#### 2. IMPACTS

The main characteristics and results of the 13 synthesis papers are summarized in the two tables presented below. For details follow this link

|   | Reference                                                                                             | Population                                   | Geographical<br>scale                                 | Intervention                                                                                                                                                                                                                                                                                                                                                                               | Control                                                                                                                                                                              | Conclusion                                                                                                                                                                                                                                                                                                                                                                                                | Quality score | Global effect                                                          |
|---|-------------------------------------------------------------------------------------------------------|----------------------------------------------|-------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|------------------------------------------------------------------------|

| 5 | Feliciano, D; Ledo,<br>A; Hillier, J; Nayak,<br>DR. 2018                                    | Agroforestry applied<br>to different land use<br>systems worldwide.                                                                                                                                                          | Global (Africa,<br>Asia, Australia,<br>Europe, Latin<br>America, and<br>North America).                                                                                                                    | Agroforestry systems:<br>silvopastoral, improved<br>fallow, agrisilvicoltural,<br>woodlots, homegarden,<br>shadow systems,<br>boundary planting.       | Non-<br>agroforestry<br>practices on<br>soil.                                                                                                                                                                          | This study found that transition<br>to agroforestry leads to net<br>carbon storage in the system.<br>This change is very clear for<br>above ground carbon. Results for<br>soil carbon sequestration were<br>not so consistent, even though a<br>positive increment in carbon was<br>observed in most cases. Large<br>differences in soil carbon<br>sequestration values among the<br>land use systems can result from<br>biophysical and socio-economic<br>characteristics of the system<br>and/or methodological issues.                                  | 62%  | Positive, compared<br>to non-agroforestry<br>practices (cropland<br>and<br>grassland/pasturela<br>nd).      |

| 13 | Ziegler, AD; Phelps,<br>J; Yuen, JQ; Webb,<br>EL; Lawrence, D;<br>Fox, JM; Bruun, TB;<br>Leisz, SJ; Ryan, CM;<br>Dressler, W; Mertz,<br>O; Pascual, U;<br>Padoch, C; Koh, LP.<br>2012 | 11 key land cover/land<br>use transitions in<br>South Eastern Asia<br>that involve swidden<br>agriculture.                                                                                                                                                                                                                           | South-eastern<br>Asia.                     | The associated land<br>covers for the transitions<br>are the following: forest;<br>logged over forest;<br>orchards and tree-<br>plantations; rubber<br>plantations; agroforest;<br>grassland, pasture, or<br>shrublands; oil palm<br>plantations; and<br>permanent cropland.                      | NA                                                                                                                | The analysis of plot-level carbon<br>outcomes highlights that in<br>some instances, lengthening<br>fallow periods of an existing<br>swidden system may produce<br>substantial carbon benefits, as<br>would conversion from intensely<br>cultivated lands to high-biomass<br>plantations and some other<br>types of agroforestry. | 31% | Positive effect of<br>agroforestry<br>compared to short-<br>fallow swidden and<br>intermediate-fallow<br>swidden. |

### 3. KNOWLEDGE GAPS

[They are extracted from each meta-analysis, synthesized and consolidated]

• Optimal designs of agroforestry systems in European conditions. Six synthesis papers out of 13 did not report data for Europe. Spatial (including soil depth) and temporal distribution of soil C is still poorly known.

## 4. SYSTEMATIC REVIEW SEARCH STRATEGY

| Keywords              | TOPIC: (agroforestry OR "agro-forestry") AND TOPIC: (meta-analy*)                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Search dates          | No time restrictions                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Databases             | Web of Science and Scopus, run on 15 May 2020                                                                                                                                                                                                                                                                                                                                                                                                           |
| Selection<br>criteria | Three main criteria led to the exclusion of a study: (1) the study does not deal with agroforestry; (2) the study does not assess the environmental and climate impacts of the farming practice on carbon sequestration; (3) the study is neither a meta-analysis nor a systematic review. Studies that passed the relevance criteria were subject to critical appraisal carried out on article by article basis. We finally selected 13 meta-analysis. |
