

SINGLE-IMPACT FICHE

SOIL AMENDMENT WITH BIOCHAR

IMPACT: AMMONIA EMISSION

Data extracted in February 2021

Note to the reader: This fiche summarises the impact of soil amendment with biochar on AMMONIA EMISSION. It is based on 2 peer-reviewed synthesis research papers¹, each of them including 41 and 208 individual studies.

1. WEIGHT OF THE EVIDENCE

- CONSISTENCY OF THE IMPACT:

Soil amendment with biochar, compared to no-biochar-amendment, led either to a negative effect (increase in ammonia emission) in one synthesis paper or to no effect in the other synthesis paper (see **Table 1**). Therefore, the effects are inconsistent.

The reviewed synthesis papers did not specify the geographical locations of the experiments (see **Table 2**).

Table 1. Summary of effects. The effect with the higher score is marked in bold and the cell coloured. The numbers between parenthesis indicate the number of synthesis papers with a quality score of at least 50%. Details on quality criteria can be found in the next section.

Impact	Metric	Positive	Negative	No effect	Uncertain
Decrease ammonia emission		0	1 (1)	1 (1)	0

- QUALITY OF THE SYNTHESIS PAPERS: *The quality score summarises 16 criteria assessing the quality of three main aspects of the synthesis papers: 1) the literature search strategy and studies selection; 2) the statistical analysis; 3) the potential bias. Details on quality criteria can be found in this document [→](#).*

As shown in the "Quality score" in **Table 2**, the quality levels are 69% and 88%. The least frequently satisfied quality criteria were "Number of studies at each step", "Individual effect sizes", "Dataset available" and "Publication bias analysed".

2. IMPACTS

The main characteristics and results of the synthesis papers are summarized in **Table 2**. Detailed results of each synthesis study are reported in the summary reports .

Table 2. Main characteristics of the synthesis papers reporting impacts of soil amendment with biochar Ammonia emission. The references are ordered chronologically with the most recent publication date first.

¹ Research synthesis papers include a formal meta-analysis or systematic reviews with some quantitative results

Reference	Population	Geographical scale	Num. papers	Intervention	Comparator	Metric	Conclusion	Quality score
Sha, ZP; Li, QQ; Lv, TT; Misselbrook, T; Liu, XJ 2019	Not specified	Global	41	Soil amendment with biochar	No amendment	Ammonia emission	Biochar addition did not have impact on ammonia volatilization, but this varied under different soil, biochar and experimental conditions.	88%
Liu, Q; Zhang, YH; Liu, BJ; Amonette, JE; Lin, ZB; Liu, G; Ambus, P; Xie, ZB 2018	Not specified	Global	208	Soil amendment with biochar	No amendment	Ammonia emission	Biochar significantly enhances soil ammonia volatilization. However, wood biochar tends to decrease soil NH ₃ volatilization.	69%

3. KNOWLEDGE GAPS

Sha et al., 2019

A significant publication bias was identified ($p < 0.05$), but use of the Fail-safe N. technique indicated that results were reliable.

Liu et al., 2018

The biochar effects synthesized in the current paper are mainly derived from experiments characterized by single-dose designs and relatively short-term time scales (months to a few years). Biochar effects with respect to longer-term and repetitive additions require further evaluation with future more relevant experimental data.

4. SYSTEMATIC REVIEW SEARCH STRATEGY

Keywords	<p>TOPIC: (biochar OR charcoal OR "black carbon") AND TOPIC: (soil OR agriculture OR farming) AND TOPIC: ("meta-analy*" OR "systematic* review*" OR "evidence map" OR "global synthesis" OR "evidence synthesis" OR "research synthesis")</p> <p>or</p> <p>TITLE-ABS-KEY: (biochar OR charcoal OR "black carbon") AND TITLE-ABS-KEY: (soil OR agriculture OR farming) AND TITLE-ABS-KEY: ("meta-analy*" OR "systematic* review*" OR "evidence map" OR "global synthesis" OR "evidence synthesis" OR "research synthesis")</p>
Search dates	No time restrictions
Databases	Web of Science and Scopus, run in February 2021

<p>Selection criteria</p>	<p>The main criteria that led to the exclusion of a synthesis paper were if the paper: 1) does not deal with agronomic application of biochar; 2) does not synthesize pairwise comparisons on the agronomic effect of biochar; 3) the control of the pairwise comparison is not no-biochar; 4) deals with soil application of mineral- or organic-enriched biochar; 5) does not report results with the same fertilisation conditions between intervention and control; 6) is either a simple review, a non-quantitative systematic review, a meta-regressions looking only at factors influences, without mean effect sizes; 7) deals with other than agricultural soils in cropping systems, e.g. forest restoration; 8) is not written in English. Synthesis papers that passed the relevance criteria were subject to critical appraisal carried out on paper-by-paper basis.</p> <p>The search returned 130 synthesis papers potentially relevant for the practice object of our fiche. Searches for other farming practices added another 2 potentially relevant synthesis papers. From the 132 potentially relevant synthesis papers, 57 were excluded after reading the title and abstract, and 34 after reading the full text according to the above-mentioned criteria. Finally, 41 synthesis papers were selected for soil amendment with biochar, from which 2 were relevant for this impact.</p>
