LIPS QA 2011 workshop, Tallinn 22nd November 2011

- 1. Essential ATS elements**
 - Implementation Conformance Statement
 - Purpose and scope of the Eligibility Profile
- 2. Performing the ETS correctly 1/2**
 - Reading the guidance
 - Setting the environment, preparing data and discarding zones
 - Inspecting the LUI and establishing non-conformities
- 3. Performing the ETS correctly 2/2**
 - Inspection errors identified during the screening of the 2010 ETS package relevant for 2011
 - Understanding the Support articles
 - Templates, Schemas and Tools
 - The LPISQA portal
- 4. Discussion + Q&A**
 - Recent MS questions
 - Technical issues only!

Environment and
Sustainability

LIPS QA 2011 workshop, Tallinn 22nd November 2011

I4: Check for data completeness and geometric consistency

- Check the statement ATS and the availability of the Eligibility Profile
- Check the temporal aspect of the reference orthoimagery (is it up-to-date?)
- Check for completeness and geometric consistency of the vector and raster data

ANNEX II: Description of the workflow, related to the inspection of the Reference Parcel, version 5.1 (Oct 2011)

The following UML diagram show the activities, related to the inspection of the Reference Parcel:

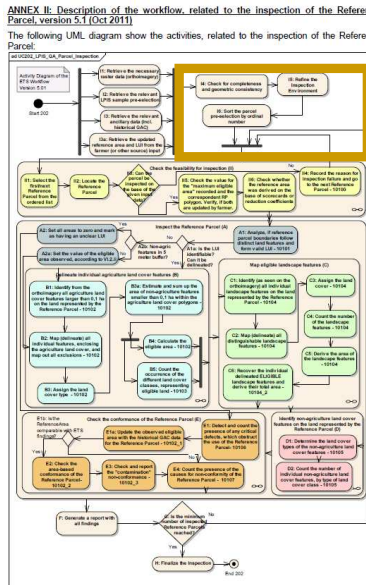

FIGURE 1: LPIS QA framework – Inspection procedure at Reference Parcel level

JRC
EUROPEAN COMMISSION

Preparing data and discarding zones

ies
Institute for
Environment and
Sustainability

LIPS QA 2011 workshop, Tallinn 22nd November 2011

I4: Check for data completeness and geometric consistency

- Navigate through the data (LPIS vectors, orthoimages)
- Check the vector and raster datasets for the relevant metadata
- Check for completeness of the vector, raster and alphanumeric data (fields and attributes)
- Check for geometric coherence (fit) between the different spatial datasets
- Check the orthoimage properties and perform image acceptance (see Detailed Instruction 1 at the end of Annex II)

In case of unacceptable quality of the raw image

Discard the whole LPIS zone!

ANNEX II: Description of the workflow, related to the inspection of the Reference Parcel, version 5.1 (Oct 2011)

The following UML diagram show the activities, related to the inspection of the Reference Parcel:

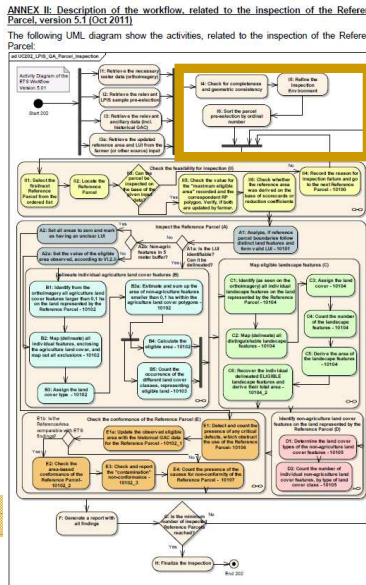

FIGURE 1: LPIS QA framework – Inspection procedure at Reference Parcel level

EUROPEAN COMMISSION

Preparing data and discarding zones

ies
Institute for
Environment and
Sustainability

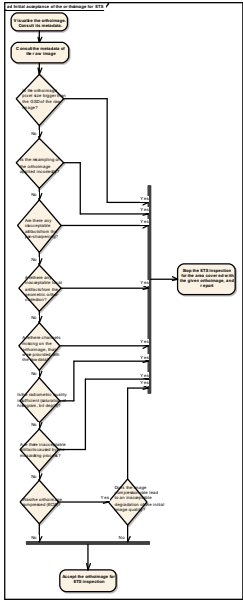

LIPS QA 2011 workshop, Tallinn 22nd November 2011

Initial acceptance of the orthoimage for ETS

- Visualize the orthoimage in question.
- Consult the metadata of the raw image and derive the image parameters.
- Check whether:
 - the orthoimage pixel size exceeds the initial GSD
 - the resampling of the orthoimage is correct
 - there are artifacts from the pan-sharpening
 - there are local artifacts from the geometric ortho-correction
 - there are channels missing on the orthoimage,
 - the radiometric quality is insufficient
 - check artifacts caused by the mosaicking process
 - the image compression rate leads to an unacceptable degradation

In case of at least one positive answer

- stop the ETS inspection for the area covered with the given orthoimage, and
- report to orthoimage producer or provider

JRC
EUROPEAN COMMISSION

Orthoimagery suitable for LPIS QA

ies
Institute for
Environment and
Sustainability

LIPS QA 2011 workshop, Tallinn 22nd November 2011

ETS uses the same VHR orthoimagery, as for the CwRS with some further restrictions:

- spatial resolution better than 1 meter**
- acquisition with off-nadir angles up to 30 degrees**
- use of the full spectral resolution of the imagery (PAN+MS recommended)**

Also considered important:

- Radiometric quality: histogram peak, contrast, color balance**
- Level of information content: Pan-sharpening, resampling**
- Level of geometric accuracy: max 2.5 RMSE 1-d might be too "loose" threshold**

JRC
EUROPEAN COMMISSION

Orthoimage technical specifications for the purpose of LPIS

ies
Institute for Environment and Sustainability

LIPS QA 2011 workshop, Tallinn 22nd November 2011

Orthoimage technical specifications for the purpose of LPIS

DO Sub elements	Conformance Quality Level & Tolerance Limits	Notes	Expected rate of conforming items
Spatial resolution	<= 1m	Ratio of the final ortho resolution to the GSD is 1:1 for digital sensors, whereas for film cameras should be at least 1.2:1	100%
Radiometric resolution	=>8 bits/channel	11-12 bits per channel is highly recommended	100%
Spectral Resolution	Color (natural or color infrared)	Panchromatic only (satellite or aerial) data is allowed, only if there is no option for color imagery	100%
General Image Quality	Lack of defects and artifacts, which could prevent the visual interpretation of the image	Checking for existence of scratches, dust, threads, hot spots, haze, drop lines, shadows, color seams, spilling, artifacts, etc	N/A (no defects allowed)
Cloud cover	<5-10%	Per image and in total. The term "image" is used for the 'control unit' e.g. orthoimage, mosaic (map sheet)	100%
Overall clipping	<0.5% at each tail	Overall clipping of the luminosity histogram	100%
Histogram Peak	+/-15% of middle value	For 8 bit image, the middle value is 128	100%
Color balance	<2% between min and max value of triplet	Not applicable for panchromatic only	100%
Noise	Signal to Noise Ratio > 12 for each channel	SNR which is defined as the ratio of the mean DN value to the standard deviation of the DN values	100%
Contrast	The coefficient of variation of the image DN values should be in the range of 10-20%	Represented as the Standard Deviation of the DN values as a percentage of the available grey levels	100%
Geometric accuracy	RMSE _x <= 2.5 m; RMSE _y <= 2.5 m	RMSE is calculated on the base of at least 20 well distributed independent check points (ICP), per image	100%
Mosaicking	DN values variation on similar area type not to exceed 10% in average (or 4% between each of the 3 channels)	.	100%
Mosaicking	Geometric mismatches along seam lines (d) <3 pixels	.	100%
Compression	Lossless (TIF, LZW-TIF) Visually lossless (JPEG2000, ECW, MrSID) at last stage (storage)	.	100%

For more information on the quality assurance and quality check, please refer to: [\[1\]](#)

EUROPEAN COMMISSION

Common problems with VHR

ies
Institute for Environment and Sustainability

LIPS QA 2011 workshop, Tallinn 22nd November 2011

- Orthorectification with sufficient, but not optimal result
 - Less accurate or wrongly positioned GCPs, coarse DEM, incomplete QC
- Improper pansharpener approach
 - Different geometric models applied for PAN and MS, wrong algorithms used
- Poor radiometric quality
 - Saturation at the edge of the histogram; information loss due to stretching
- Loss of image detail
 - Wrong pansharpener, inappropriate resampling technique used, improper rescaling performed

Setting the environment

ies
Institute for
Environment and
Sustainability

LIPS QA 2011 workshop, Tallinn 22nd November 2011

I5-I6: Refine the Inspection Environment and Sort the pre-selection

- Enhance or change, if necessary, the radiometric and spectral parameters of the orthoimage
- Set the ranges for the visual scale
- Adapt the visual appearance of the graphical data (modify colours, add labels if necessary)
- Sort the parcel pre-selection by ordinal number

ANNEX II: Description of the workflow, related to the inspection of the Reference Parcel, version 5.1 (Oct 2011)

II3: Can the parcel be inspected on the base of the given input data?

Inspection of the Reference Parcel

Analyse visually, if the LUI can be inspected based on the available input information.

Check:

- RP ID persistency in the LPIS
- Geometry validity of the RP
- Availability of meaningful image over the entire RP
- Presence of cloud cover/haze on image
- Sufficient radiometric/geometric quality
- Presence of force major factors preventing the ETS

Check the conformance of the Reference Parcel (E)

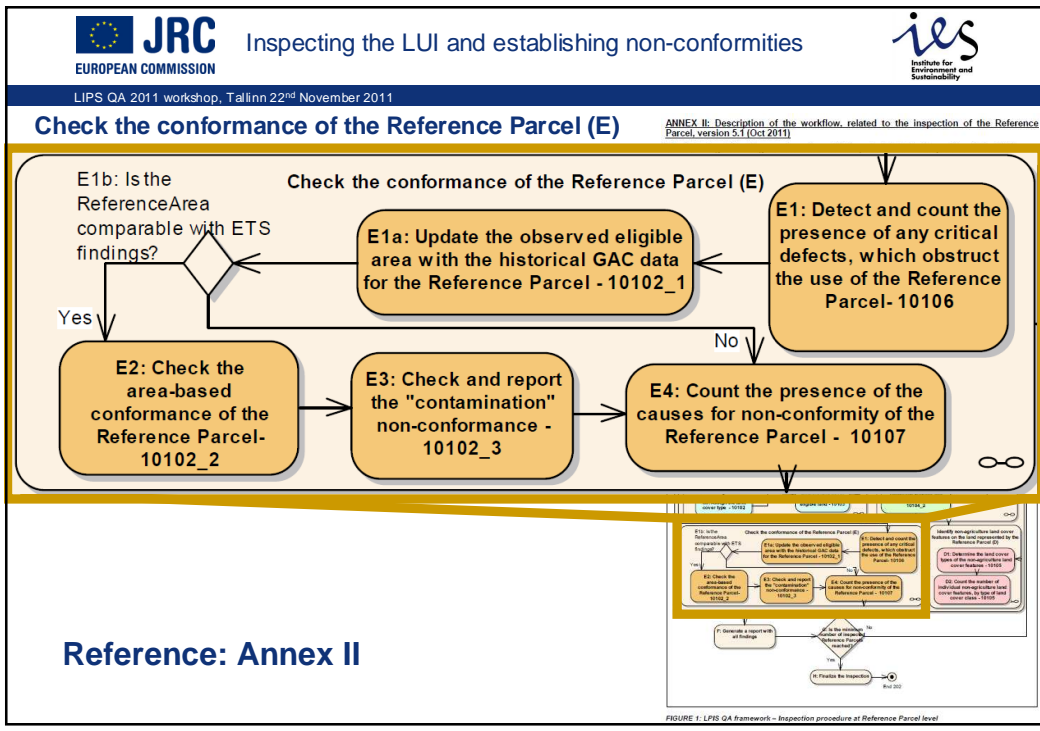

ANNEX II: Description of the workflow, related to the inspection of the Reference Parcel, version 5.1 (Oct 2011)

The following UML diagram shows the activities, related to the inspection of the Reference Parcel:

The UML activity diagram illustrates the workflow for inspecting a Reference Parcel. It starts with 'Acquire Data from the Reference Parcel' (A1) and 'Check the conformance of the Reference Parcel' (A2). The process involves several steps: 'Check the conformance of the Reference Parcel' (A2) leads to 'Check the conformance of the Reference Parcel' (A3), which then leads to 'Check the conformance of the Reference Parcel' (A4). The diagram includes various decision points and loops, such as 'Check the conformance of the Reference Parcel' (A5) and 'Check the conformance of the Reference Parcel' (A6). The final step is 'Finalize the Inspection' (A7).

Example dataset parameters

Critical Defect
Total absence of eligible featur
Invalid RP perimeter
Invalid Common RP boundary
Incomplete block
Multi-polygon
Multi-parcel

Example quality result meaning

Critical Defect	Local Ground Conditions
Total absence of eligible features (or land)	Applicable only for reference parcels, holding "non zero" maximum eligible area ReferenceArea). Total lack of agriculture land cover, which might represent eligible land on the area represented by the Reference Parcel. <i>The total absence of eligible land indicates an evident problem.</i>
Invalid RP perimeter	Applicable only for reference parcels that cannot be measured and have non-agricultural elements within 5m of the LUI boundary. <ul style="list-style-type: none">None of the RP perimeter "prime" vertices, which outline the shape of the LUI, correspond to the observed ground truth (as visible through the existing land cover, land use features). <i>These parcels are virtual and so irrelevant for land administration.</i>
Invalid common RP boundaries	Applicable only for physical and topographic block systems (PB, TB). <ul style="list-style-type: none">The Land use / land cover counter-indicates the presence of common stable physical boundary between the inspected reference parcel and at least two of its neighbouring reference parcels.AND the common boundary location cannot be derived from surrounding land cover / land use elements. <i>These parcels represent sub-parcels of larger units.</i>
Incomplete block	Applicable only for (production) block systems (AP/FB/TB/IPB) <ul style="list-style-type: none">The Land use / land cover counter-indicates the presence of a true stable physical boundary of the blockAND the LPIS does not hold a neighbouring non-zero MEA parcel where the farmer can declare that land clearly in his use.AND this unaccounted land use indicates that more than 10 percent or 2000m2 (whichever is LARGER) of the block area value is missing from the LPIS.AND the LPIS QA inspection cannot produce external evidence that the land tenure of this unaccounted part of the block is held by a farmer who is not receiving any aid for the assessment year. <i>These parcels prevent the neighbouring, potentially eligible land, land from being declared.</i> NOTE: The presence of a neighbouring reference parcel is <u>not</u> restricted to parcels within the scope of the current assessment year.
Multi-polygon	Applicable only for (production) block systems (AP/FB/TB/IPB) A multi-polygon is a situation where one block (i.e. one RP identifier for is actually composed of two or more disjoint polygons. <i>The issue with multi-polygon is that it does not allow unambiguous location of the agricultural activity, even if managed by the same farmer.</i> NOTE: Internal or adjacent polygons representing sub-divisions in a single production block are not multi-polygon defects.
Multi-parcel	Applicable only for (production) block systems (AP/FB/TB/IPB) The inspected reference parcels is an amalgamate of 10 (ten) or more clearly distinct parcels (i.e. units of agriculture land which according to the internal rules should have been processed separately). <i>The issue with multi-parcel is that it spreads or "blurs" the information over several land units, adversely affecting field identification and land use accuracy.</i>

E1a: Update the observed eligible area with the historical GAC data for the Reference Parcel - 10102_1

ANNEX I: LPIS quality measures, version 5.1 (Oct 2011)

TABLE 7.2: RP GAC area (10102_1)

Data quality components (Short name)	
DQ_Name	RP Historical GAC area
DQ_Alias	RP_MEA_GAC
DQ_Scope	All single land cover features, which are on the land represented by the Reference Parcel (relevant for all RPs that that can be measured and also have historical GAC limitations presented on their LUIs)
DQ_Subelement	5 - thematic accuracy
DQ_Measure	1 - Classification correctness
DQ_MeasureDef	Correct GAC area value
DQ_MeasureDesc	Observed eligible area on the land represented by the Reference Parcel, which is in good agriculture condition (GAC) on 30 of June 2003
DQ_MeasureRefSource	Observed eligible area for the Reference Parcels, clipped with the historical GAC mask
DQ_MeasureID	10102_1
DQ_EvalMethod	2-external
DQ_EvalMethodType	2-external
DQ_EvalMethodDesc	See Actions E1a from the Annex "Activity Diagram". Spatially intersect all single agriculture land cover features and eligible landscape features on the land represented by the Reference Parcel, which were individually mapped in measure 10102, with the vector data representing the land in GAC on 30 of June 2003 (Historical GAC mask). Consult the results from the ATS (Module A_122), in order to retrieve the information and data on GAC. Calculate the eligible area from the clipped polygon area, using the information from the eligibility profile. Report the total observed eligible area for the Reference Parcel.
DQ_Quantity/Result	2 - number
DQ_ValueType	18000
DQ_Value (example)	18000
DQ_ValueUnit	square meters
DQ_Date	yyyy-mm-dd
DQ_ConformanceLevel	Not specified
DQ_dataset parameters	18000 square meters of eligible land found on the area represented by the Reference Parcel are within the historical GAC mask.
DQ_quality result meaning	18000 square meters of eligible land found on the area represented by the Reference Parcel, were actually in good agriculture conditions on 30 of June 2003

E2: Check the area-based conformance of the Reference Parcel- 10102_2

E3: Check and report the "contamination" non-conformance - 10102_3

ANNEX I: LPIS quality measures, version 5.1 (Oct 2011)

TABLE 8: RP Area purity (10102_2)

Data quality component (Short name)	RP conformance (area purity)
DQ_Name	RP_CNF
DQ_Alias	RP_CNF
DQ_Scope	All eligible land found on the land rep Reference Parcel. NOTE: The meas. those RP's that can be measured. Those RP's that are not directly comparable (see Annex II), are not included.
DQ_Element	5 - thematic accuracy
DQ_Subelement	3 - Quantitative attribute correctness
DQ_Measure	Correct items rate
DQ_MeasureDef	Correctness of the eligible area recorded for the Reference Parcel, in respect to the eligible area observed.
DQ_MeasureDesc	Percentage of the eligible area observed with respect to the eligible area recorded in the attribute table of the Reference Parcel.
DQ_MeasureRefSource	
DQ_MeasureID	10102_2
DQ_EvalMethod	
DQ_EvalMethodType	1-internal
DQ_EvalMethodDesc	NOTE: In order to calculate the eligible area found, sum up the values derived in 10102 (or 10102_1 if appropriate) and 10104_2. See Annex E2 from the Annex "Quality Diagram". Compare the sum of square meters found eligible with respect to those recorded as eligible in the attribute table of the Reference Parcel. Sum up the area found to be eligible - Aobs. Then: 1. Divide the result (Aobs) by the area recorded as eligible in the attribute table of the Reference Parcel (Arec). Multiply by 100. Report the value. (v1) 2. Subtract (Aobs) from the area recorded as eligible in the attribute table of the Reference Parcel (Arec). Report the value (in absolute terms) (v2).
DQ_QualityResult	
DQ_ValueTypes	V1: 4 - percentage AND V2: 2 - number
DQ_Values	V1: 95.00% AND V2: 6750m ²
DQ_ValueUnits	V1: Percent (%) AND V2: square meters (m ²)
DQ_Date	yyyy-mm-dd
DQ_ConformanceLevel	For Reference parcels with area recorded greater than 5000m ² : • (v1) between (or equal to) 97.00 % and 103.00 % AND • (v2) Not greater than 10 000 m ² . For Reference parcels with area recorded between (or equal to) 2000m ² and 5000 m ² : • (v1) between (or equal to) 95.00 % and 105.00 %. For Reference parcels with area recorded less than 2000 m ² : • (v1) between (or equal to) 93.00 % and 107.00 %
Example dataset parameters	13 500 square meters recorded eligible in the attribute table of the Reference Parcel. 12 825 square meters found to be eligible.
Example quality result meaning	Reference Parcel fails. Less than 97.00% of the square meters recorded as eligible in the attribute table of the Reference Parcel, are found as eligible.

Compare the

- observed eligible area Aobs (updated with the GAC mask) and the
- recorded reference area Arec

For Reference parcels with area recorded greater than 5000m².

- (v1) between (or equal to) 97.00 % and 103.00 % AND
- (v2) Not greater than 10 000 m².

For Reference parcels with area recorded between (or equal to) 2000m² and 5000 m².

- (v1) between (or equal to) 95.00 % and 105.00 %

For Reference parcels with area recorded less than 2000 m².

- (v1) between (or equal to) 93.00 % and 107.00 %

ANNEX I: LPIS quality measures, version 5.1 (Oct 2011)

DETAILED INSTRUCTION 2: Application of waivers, which can vindicate a reference parcel contaminated by ineligible features.

The Commission issues the following waivers and Member States may choose to activate these waivers to vindicate an observed contamination of the LUI by one or more ineligible features.

For each occurrence

- **Check if the observation violates the relevant general and local ETS condition for each of the three waivers**
- **Indicate which waiver vindicates the observed contamination, where applicable,**
- **Flag the parcel as non-conforming, if at least one occurrence of ineligible feature remains "unwaivered".**

➤ Waiver C essentially requires documentation indicating that the contamination inside the LUI was known and dealt with appropriately.

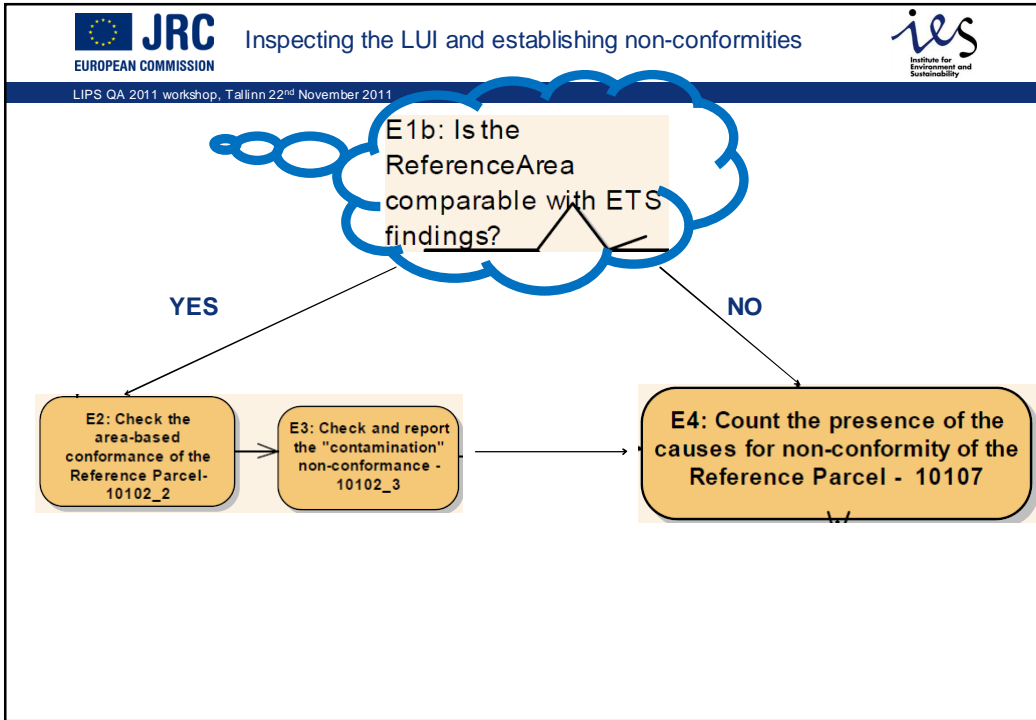

Quality measures, version 5.1 (Oct 2011)

"contaminated" Reference Parcel (10102_3)

Quality components (Short name)	RP Conformance ("Contaminated" reference parcel)
	RP_CNT
	All land cover features, which are on the land represented by the Reference Parcel. NOTE: The measure is applicable only for those RPs found to be conformant in respect to quality measure 10102_2

LIPS QA 2011 workshop, Tallinn 22nd November 2011

E4: Count the presence of the causes for non-conformity of the Reference Parcel 10107

Causes for occurrence of non-conformity in the Reference Parcels	Occurrence
Changes of the underlying land were not applied	
Revisions of the Regulations were not applied	
Incomplete processing	
Erroneous processing	
Incompatible LPIS design	
Observed eligible area is not in GAC on 30 of June 2003	

ANNEX I: LPIS quality measures, version 5.1 (Oct 2011)

DETAILED INSTRUCTION 3: Categorization of the non-conforming reference parcels

In order to decide, if a particular cause can explain the observed non-conformity, the operator should perform a minimum set of actions, specific for each cause. They are listed below (for each cause separately). This list of actions is considered exhaustive. Continue to cascade down until the correct cause is determined:

1. For system under SAPS with historical GAC only: the observed eligible area was not in GAC on 30 of June 2003.
 - Check the availability of historical GAC mask (by consulting the Sub-Modules A_122 "representation of historical eligibility" of the ATS)
2. Changes of the underlying land were not applied
 - Check the date of validity of the reference parcel (by consulting the value effectiveDate in the LPIS for that parcel - see also Sub-Module A_131 of the ATS)
 - Check any archive reference data (orthoimagery, topomaps, cadastral plans,...)

Typical examples are a newly constructed road or building that is still being considered agricultural land or a recent conversion into agricultural land that has not been taken into account.
3. Revisions of the Regulations were not applied
 - Check the rules on eligibility applied for the given LPIS lot (by consulting the eligibility profile and the reporting on Module A_12 "Eligibility and land cover types" of the ATS)

Typical examples are an underestimate of the maximum eligible area because the abolishment of separate schemes (olives, vineyards, decouplement,...) or a creation of new schemes (retention of landscape features) have not been introduced in LPIS.
4. Incomplete processing
 - Check the availability of separate datasets or layers, which store small exclusions or landscape features (by consulting the Sub-Modules A_123 and A_124 of the ATS)
 - Check archive reference data (orthoimagery, topomaps, cadastral plans,...)

Typical examples are that a separate sub-parcel or eligibility layer, although foreseen in the LPIS design, has not been produced for the full LUI or that a validation procedure, although required by the LPIS creation specifications, has not been performed (a particular example is where a military mask prevented photo interpretation in the past and the parcel was "cut off" at the mask).
5. Erroneous processing
 - Check the validity date of the reference parcel (by consulting the value effectiveDate in the LPIS for that parcel - see also Sub-Module A_131 of the ATS)
 - Check archive reference data (orthoimagery, topomaps, cadastral plans,...)

Typical examples are that the operator has used inappropriate (e.g. outdated) source material or there has been a manifest deviation from the documented instructions.
6. Incompatible LPIS design
 - Check the definition of the Reference Parcel (by consulting Module A_11 of the ATS)
 - Consult historical data

This is the situation that has not been foreseen in the specifications and cannot be explained by any of the above causes.

Typical example could be a reference parcel of AP type, detected during the ETS as being a multi-polygon.
