

SDW-3: INSPIRE download services based on OGC API - Features

OGC API - Features (previously called Web Feature Service 3.0) is an evolution of the [OGC's](#) Web Feature Service standard for querying geospatial information on the web. It is a complete rewrite of previous versions, focusing on a simple RESTful core specified as reusable [OpenAPI](#) components with responses in JSON and HTML. More information can be found from [on this Github space](#).

TODO:

- Add some information on the activity in the MIG
- Upload the different versions of the mapping discussion paper (links to MIG-T meetings, where relevant)
