

How to visualise a 3 or 4 dimensional view

Import remarks

- This feature is available only for the **Table** visualisation.
- This feature is available only for datasets which include more than two dimensions.

- Click on **Table** tab to visualise the data within a table:

The table displays:

IT	TIME	2009	2012	2015	2018
GEO

Multi-dimensional support and visualisations

The multi-dimensional view feature is only available in **Table** visualisation. The **Bar** and **Line** visualisations only support two dimensions at the same time.

In some cases, when you define breakdowns (= selects 3 or 4 dimensions) in **Table**, then switch to another visualisation mode, you won't be able to change the layout (dimensions) as long as you don't come back to **Table**. However, it is still possible to modify the selected positions /values in each dimension.

Example:

- **Step 1:** Initially, the table in the example displays with two dimensions: **TIME** (in Column) and **GEO** (in Row).

- **Step 2:** The user changes the layout: he adds the **Land use** dimension as breakdown in Column.

- **Step 3:** If the user tries to go to the **Line** visualisation, an error message is displayed, and the breakdown inserted before (**Land use**) is fixed to one value and located in **Page** part, which allows to display the line chart. The user cannot however change the layout while in **Line** in this case:

- **Step 4:** If the user goes back to **Table** visualisation, he gets back the breakdown previously defined. He can then remove the breakdown (by moving back **Land use** dimension to **Page** part). Once the breakdown is removed from Column, the user can switch to **Line** again. The breakdown having been removed, the user is able to change the layout again (on **Series** part):
