

Belgium

The Belgian National Strategy for Pollinators, which covers the period 2021-2030, aims for a future in which pollinators, as umbrella species, thrive and provide their essential services by benefiting biodiversity, the health of ecosystems, food production and human well-being. The strategy has the following objectives:

1. Increase the extent, quality, diversity and connectivity of habitats (foraging areas and nesting sites) and food resources available to support communities of healthy wild and managed pollinators across the country;
2. Mitigate factors contributing to pollinator species decline and prevent their extinction;
3. Increase the resilience of all pollinators to climate change and extreme weather events;
4. Raise awareness among various actors (public and private) and train sectors which are key to solving the problem;
5. Improve collaboration between all stakeholders, especially between different authorities concerned;
6. Increase the evidence-based database needed to support policies and effective actions, and monitor their impact.
